Reduction of GHG emissions from ships

Reduction of GHG emissions from ships

Initial IMO Strategy on Reduction of GHG Emissions from Ships

- **MEPC 72 adopted** a Resolution on “Initial IMO Strategy on Reduction of GHG Emissions from Ships”.

INITIAL IMO STRATEGY ON REDUCTION OF GHG EMISSIONS FROM SHIPS	
Contents	
1	INTRODUCTION
2	VISION
3	LEVELS OF AMBITION AND GUIDING PRINCIPLES
4	LIST OF CANDIDATE SHORT-, MID- AND LONG-TERM FURTHER MEASURES WITH POSSIBLE TIMELINES AND THEIR IMPACTS ON STATES
5	BARRIERS AND SUPPORTIVE MEASURES; CAPACITY-BUILDING AND TECHNICAL COOPERATION; R&D
6	FOLLOW-UP ACTIONS TOWARDS THE DEVELOPMENT OF THE REVISED STRATEGY
7	PERIODIC REVIEW OF THE STRATEGY

Reduction of GHG emissions from ships

Initial IMO Strategy on Reduction of GHG Emissions from Ships

- Levels of ambition

Subject to amendment depending on reviews to be conducted by the IMO, the Initial Strategy identifies levels of ambition for the international shipping sector ...

.1	Carbon intensity of the ship to decline through implementation of further phases of the energy efficiency design index (EEDI) for new ships
	to review with the aim to strengthen the energy efficiency design requirements for ships with the percentage improvement for each phase to be determined for each ship type, as appropriate;
.2	Carbon intensity of international shipping to decline
	to reduce CO₂ emissions per transport work , as an average across international shipping, by at least 40% by 2030 , pursuing efforts towards 70% by 2050, compared to 2008 ; and
.3	GHG emissions from international shipping to peak and decline
	to peak GHG emissions from international shipping as soon as possible and to reduce the total annual GHG emissions by at least 50% by 2050 compared to 2008 whilst pursuing efforts towards phasing them out as called for in the Vision as a point on a pathway of CO ₂ emissions reduction consistent with the Paris Agreement temperature goals.

Reduction of GHG emissions from ships (Related to EEDI)

Under discussion
(To be completed in MEPC 74)

- Further review of EEDI – beyond phase 2
 - **MEPC 70** agreed that the aforementioned review should be finalized in time for adoption of **the necessary amendments to MARPOL Annex VI** with a view to **early implementation of phase 3 in 2022** and, if agreed, **introduction of phase 4** as soon as possible.

Air pollution (SOx Control)

The 2020 Global Sulphur Limit

Do you expect the IMO global emission regulations to become enforceable as planned as from 2020?

(Source: Drewry Maritime Research (08 Apr 2018))

There is still uncertainty among shipowners ...

Frequently Asked Questions

The 2020 global sulphur limit

- **Can this date be changed?**

The date is set in the MARPOL treaty. So it can only be changed by an amendment to the MARPOL Annex VI. This would require a proposal for an amendment to be put forward by a Member State that is a Party to Annex VI, that proposal then circulated and finally adopted by MEPC. An amendment to MARPOL is required to be circulated for a minimum of six months prior to adoption and then can only enter into force a minimum of 16 months after adoption.

Given that Parties to MARPOL Annex VI decided in October 2016 to implement the 2020 date, it is not anticipated that such a proposal would be forthcoming.

- **So can there be a delay in implementation?**

No, legally, there can be no change in the 1 January 2020 implementation date, as it is too late now to amend the date and for any revised date to enter into force before 1 January 2020.

However, IMO Member States will work in the relevant IMO technical bodies to address any issues that might arise with regards to ensuring consistent implementation.

Options for Ship Owners

How do you intend to ensure emission compliance for your existing fleet?

(Source: Drewry Maritime Research (08 Apr 2018))

Options for Ship Owners

Solution	Method	Pros	Cons	Likelihood
Do Nothing i.e. switch to distillate fuel in 2020	<ul style="list-style-type: none"> Lower fuel sulphur content (including blended fuel) 	<ul style="list-style-type: none"> Safe Proven Limited technology investment needed 	<ul style="list-style-type: none"> Higher fuel cost Fuel availability uncertain 	<ul style="list-style-type: none"> Considered to be the most likely option for majority of vessels
Alternative Fuels e.g. LNG	<ul style="list-style-type: none"> Switch to using less polluting fuels 	<ul style="list-style-type: none"> LNG: very low NOx, SOx and PM c.20% reduction in CO₂ emissions Cost competitive fuel 	<ul style="list-style-type: none"> Retrofit complex and expensive Technology is costly Fuel availability uncertain - bunkering infrastructure limited Cargo capacity 	<ul style="list-style-type: none"> Retrofits of existing ships unlikely Approaching 10% of orderbook with LNG as fuel Mainly LNG carriers/ Ferries/ Cruise – uptake likely to be much slower in volume sectors Certain owners looking at other fuels including LPG
Exhaust Gas Cleaning Systems /SOx Scrubbers	<ul style="list-style-type: none"> <u>Open Loop</u>: exhaust gases mix with seawater, forms sulphuric acid which is then neutralised by the alkaline components in seawater and discharged overboard <u>Closed Loop</u>: gases are cleaned with seawater mixed with caustic soda. <u>Hybrid</u>: capable of using both methods. 	<ul style="list-style-type: none"> SOx emissions reduced by more than 90% PM emissions reduced by 60-90% Enables continued use of cheaper HFO 	<ul style="list-style-type: none"> Significant investment/ payback period Additional operational costs associated with catalyst, increased power and disposal of sludge Issues with wash water discharge Long term availability of low cost HFO 	<ul style="list-style-type: none"> Some uptake in orderbook but many owners unlikely to make CAPEX commitment (at least pre-2020).

LNG as an alternative fuel

Pros

- SOx reduction of abt. 100 %
- NOx reduction of up to 80-90 %
- CO2 reduction of 10-20 %
- Reduction of particulates
- Positive impact on EEDI
- Clean burning => less maintenance
- Chartering preference
- Second-hand value
- Better crew retention

Cons

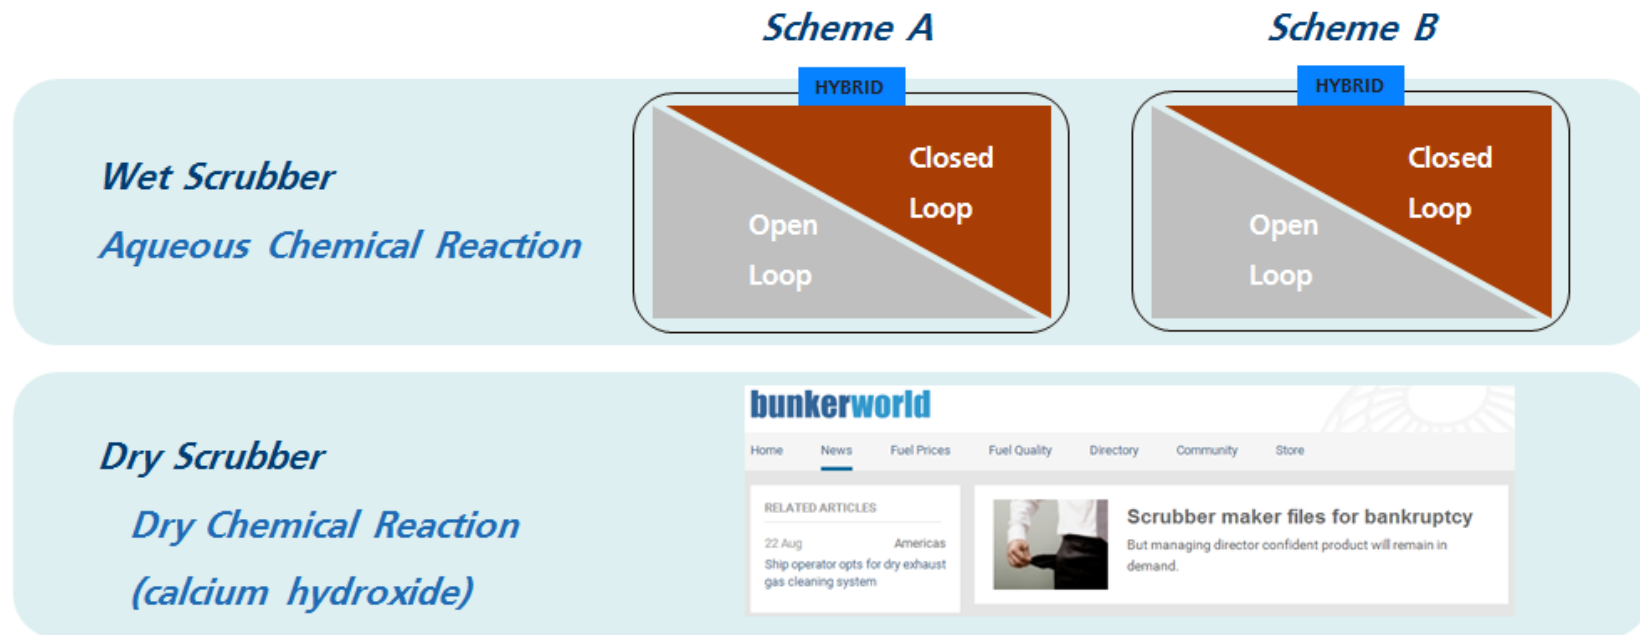

- "New" technology as primary fuel
- Manoeuvre./low load on compliant fuel
- Possible methane slip
- May cause loss of cargo space
- Increased newbuilding/retrofit cost
- Availability of LNG
- Possible time constraints for bunkering
- Investment in crew training
- LNG price uncertainty

IGF Code (ships contracted on or after 1 January 2017 or delivered on or after 1 January 2021)

Lloyd's Register Rules for the Classification of Natural Gas Fuelled Ships

SOx Scrubber

- Fuel prices make exhaust gas cleaning attractive. There are two technologies capable of cleaning exhaust gas;

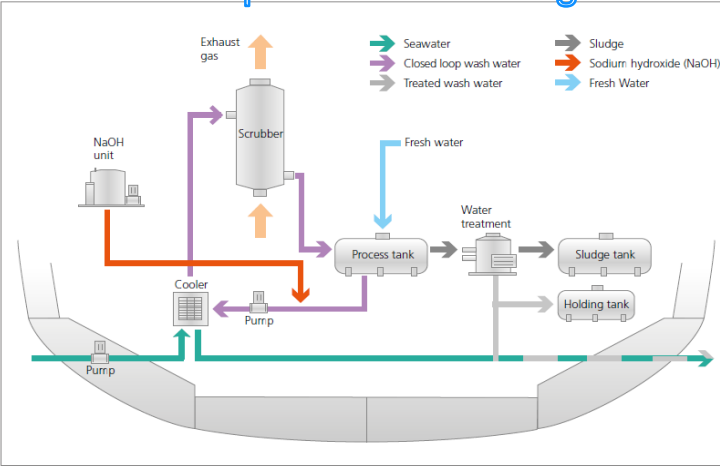

Wet exhaust gas scrubbers

Open loop scrubber arrangement

Closed loop scrubber arrangement

- Exhaust gas passed through water curtain
- Open and/or closed loop systems
- May present significant size and weight issues
- Requires a water treatment plant
- Significant energy consumption
- May not be compatible with SCR systems
- Possible **discharge restrictions** for **open loop** in certain territorial waters

Air pollution (NOx Control)

NOx Emission Control Requirements

NOx emission control requirements(Reg.13 of MARPOL Annex VI)

- Applicable to each marine diesel engine with a power output of more than 130 kW installed on a ship

n = rated engine speed (crankshaft RPM)	Tier I	Tier II	Tier III
	1 January 2000 ≤ K/L < 1 January 2011	1 January 2011 ≤ K/L	1 January 2016 ≤ K/L
n < 130 rpm	17.0 g/kWh	14.4 g/kWh	3.4 g/kWh
130 rpm ≤ n < 2000 rpm	$45.0 \times n^{(-0.2)}$ g/kWh	$44.0 \times n^{(-0.23)}$ g/kWh	$9 \times n^{(-0.2)}$ g/kWh
2000 rpm ≤ n	9.8 g/kWh	7.7 g/kWh	2.0 g/kWh

- Ships (keel-laid on or after **1 January 2016**) operating in **the North American area** or **the U.S. Caribbean Sea area**
- Ships (keel-laid on or after **1 January 2021**) operating in **the Baltic Sea** or **the North Sea (including English Channel)**

Options for Ship Owners

Solution	Method	Pros	Cons
Selective Catalytic Reduction (SCR)	<ul style="list-style-type: none"> Use of urea and catalyst, which is added to the exhaust gas system 	<ul style="list-style-type: none"> Effective for most engine load range Larger reference base More widely tested by owners, especially in Norway 	<ul style="list-style-type: none"> High capital cost Regular urea resupply Not suitable for low engine load Space for urea tank required Ongoing cost of purchasing chemical agents
Exhaust Gas Recirculation (EGR)	<ul style="list-style-type: none"> Recirculation of cooled exhaust gas into the charge air, to be used again in the combustion process 	<ul style="list-style-type: none"> Space saving Low operating expenditure 	<ul style="list-style-type: none"> Reduced engine efficiency High initial investment, retrofits are particularly expensive Caustic soda required Disposal of wash water and sludge May not reduce emissions enough to comply with tier II limit without changes in engine operation or type of fuel used
LNG Fuel	<ul style="list-style-type: none"> Lean-burn natural gas engines 	<ul style="list-style-type: none"> No SOx emission Particulate matter and CO2 reduction Competitive fuel cost 	<ul style="list-style-type: none"> High LNG conversion cost LNG bunkering facility limited Reduce of cargo space onboard May not itself be enough to meet Tier III limits

```

graph LR
    A[Exhaust gas receiver] --> B[SCR]
    B --> C[Turbocharger]
    C --> D[ ]
    style D fill:none,stroke:none
  
```

The diagram illustrates the exhaust system components and their flow. It starts with an 'Exhaust gas receiver' (a rounded rectangle), followed by an arrow pointing to an 'SCR' (a square box). Another arrow points from the 'SCR' to a 'Turbocharger' (a trapezoidal shape). A final arrow points away from the turbocharger, indicating the exhaust path.

must have an IHM *
(latest application date)

???
Hong Kong Convention
ratified at IMO

Timeline

Dec 2013
EU SRR adopted

Dec 2016
All EU Flagged ships
going for recycling must
have an IHM *

(31 December 2020)

Dec 2020
EU Flagged existing
ships & non-EU Flagged
ships calling at EU ports
must have an IHM

For EU flagged existing ships &
non-EU flagged ships...

7 years from Entry into Force until the latest Application Date

* Application dates apply 6 months after the date on which the EU List (of authorised Recycling Facilities) reaches 2.5m LDT

Note: As of summer 2015 the EU is yet to start receiving or processing applications to the EU List; therefore, latest application date seems most likely

In November 2016, EMSA, the European Maritime Safety Agency, published a Best Practice Guidance on the Inventory of Hazardous Materials...

EU SRR (No.1257/2013)

PFOS (Annex I)

Newbuild

EU Flag

- Table A / Annex I prohibited on new installations

Non-EU Flag

X

- Not applicable for ships flying the flag of a third country.
- Newbuilds are an existing ship when they enter EU ports.

Existing

EU Flag

- Upon Entry into force the IHM should identify at least Table A / Annex I hazards (EU SRR Article 5[2])

Non-EU Flag

X

- Not applicable for ships flying the flag of a third country.
- Installation whilst in EU port or anchorage is restricted (EU SRR Article 12 [2])

HBCDD (Annex II)

Newbuild

EU Flag

- Table B / Annex II & should be identified (Article 5[1]).
- Eliminated from use - Stockholm Convention.
- EC 1907/2006 requires ban from 21/08/2015.

Non-EU Flag

X

- Table B / Annex II & should be identified as far as practicable (Article 5[2]).

Existing

EU Flag

X

- Table B / Annex II & should be identified as far as practicable (Article 5[2]).

Non-EU Flag

X

- Table B / Annex II & should be identified as far as practicable (Article 5[2]).

EU SRR, Annex I – PFOS

Structure / Equipment	Component
Firefighting equipment	<p>Firefighting foams of the type AFFF (Aqueous Film Forming Foams).</p> <p>Typical on a range of ship types but specifically those;</p> <ul style="list-style-type: none">– carrying inflammable fluids– with a helicopter deck
Machinery Rooms	<p>AFFF typically stored in one tank serving a main system, potentially with additional smaller and separate devices (for example 20 litres).</p> <ul style="list-style-type: none">– Concentration of PFOS normally lay within 0.017-0.037 kg/litre foam.– Total on-board volumes range between 100 – 10,000 litres
Throughout vessel	Hydraulic fluids
	Cable sheath
	Coatings
	Adhesives

EU SRR, Annex II – HBCDD

Structure / Equipment	Component
Liquefied Gas Tanks	Expanded polystyrene (EPS) used for cryogenic insulation
Thermal Insulation boards	Foam materials
Rubber and plastic materials	Cable Sheaths
	PVC flooring
	Gaskets
Switch boards	Seals
	Switch plug cover
	Polymer material of switch board
Electrical extension cover	
Flooring materials	
Coatings	Paint
